Mumps - 2 doses

Flu (Influenza) - 18 doses
Diphtheria - 6 doses
Tetanus - 6 doses
Pertussis - 6 doses
Polio - 5 doses
Hib - 4 doses

Are Vaccinated Children Healthier?

The most important question a parent ought to be asking is – Will my child be healthier as a result of vaccination? A 2018 Raising Canada report conducted by the O'Brien Institute for Public Health concluded that *"There is a failing state of children's health today."*

The question is why? **Our children receive three times as many vaccine doses today compared to the 1980's.** If vaccines improved health, our children should be healthier, not sicker.

The Journal of Translational Science published the first independent study comparing the overall health of vaccinated and unvaccinated 6 to 12 year old children in the United States. The results of the study reveal that while vaccinated children were significantly less likely to have chicken pox or whooping cough, they were significantly more likely to have pneumonia, allergies, ear infections, eczema, learning disabilities, Attention Deficit Hyperactivity Disorder (ADHD), Autism Spectrum Disorder, neuro-developmental disorders, and chronic illness.

THE CHOICE IS YOURS

You have the right to refuse any or all vaccines. In 1996, Health Canada's National Report on Immunization stated: *"Unlike some countries, **immunization is not mandatory in Canada**; it cannot be made mandatory because of the Canadian Constitution... legislation and regulations must not be interpreted to imply compulsory immunization."*
