

Facts:

- COVID-19 shots are **EXPERIMENTAL**. Safety trials will not be complete until 2022/2023. Ample evidence is available from leading medical experts, peer-reviewed studies, and adverse events reports regarding the known and unknown harms of COVID -19 gene therapy on our 12 to 18 year olds.
- COVID shots may cause life-long injury and death, infertility, miscarriages, and birth defects, may alter human genetics, have not undergone adequate and complete safety testing, and have not been proven to stop infection or transmission.
- **COVID survival rate is ~99.85% for all ages.** Does the evidence justify mass vaccination with a rushed to market, inadequately tested, experimental vaccine?

"Use of experimental inoculations in children 12 - 18 years for whom there is vanishingly little risk from COVID - 19, no health benefit, and well-documented risk including death from the inoculation, is an egregious violation of our legal and moral obligation to safeguard the health of well-being of our children."

- Lawyer, Rocco Galati
