

THE CHOICE IS YOURS

In BC parents have the right to refuse any or all vaccines for infants & children. A simple letter of refusal is sufficient for children attending school or day care. You can refuse to disclose your child's private medical information. If your child has visited a doctor & has a health card, it's likely the government already has your child's vaccine record.

Health Canada has stated: ***“Unlike some countries, immunization is not mandatory in Canada; it cannot be made mandatory because of the Canadian Constitution... legislation and regulations must not be interpreted to imply compulsory immunization.”***

What's in Vaccines?

- **Complex biochemical substances including** DNA debris from animal and aborted fetal tissue, foreign proteins, cell fragments, bovine serum albumin, viral and bacterial particles, emulsifiers, neurotoxins, formaldehyde, monosodium L-glutamate, egg proteins and much more.
- **Aluminum Adjuvant:** Neurotoxin that triggers brain inflammation and is linked to brain injuries and auto-immune disorders. A child who receives the full vaccine schedule by grade 7, will have been injected with **7210 mcg** of aluminum adjuvant.
- **Mercury (thimerosal) preservative:** A neurotoxin contained in some multi-vial doses of influenza vaccine. Depending on the brand, 2 doses injected in the first year of life may contain nearly 25 micrograms of mercury.
- **Polysorbate 80:** An emulsifier that crosses the blood brain barrier allows vaccine ingredients into the brain. Causes infertility in animal studies.
- **Human DNA:** Many live viral vaccines are contaminated with aborted fetal DNA debris which is associated with autistic disorder and epidemic childhood leukemia and lymphomas (Ref: T. Deisher).

The highest number of vaccine doses are given in the first 2 years of life during critical phases of brain and immune system development. Vaccines can trigger brain inflammation, derail normal brain development, impair thinking, concentration, attention, behavior, language and cause neurological motor injuries. Vaccines are not evaluated for carcinogenic or mutagenic potentials or impairment of fertility. Read Vaccine Product Monographs available at www.vaccines411.ca under the health professionals tab.

Make an Informed Vaccine Decision.
