

What won't work

1 Mandatory Vaccination

Mandatory vaccine policy is a clear and direct violation of the Nuremberg Code developed in response to the medical experimentation conducted by the Nazis in WWII, as well as a violation of the Universal Declaration on Bioethics and Human Rights. To impose vaccines without consent is medical tyranny.

2 Lack of Legal Accountability

Currently the vaccine industry in the United States has legal immunity, and 'effective legal immunity' in Canada. This means the vaccine industry is not legally liable for the safety of their products. The lack of legal accountability removes an important and effective measure to ensure products are safe and effective. A consequence of this legal immunity is there is no legal or financial incentive for the medical industry to make vaccines safer, even when there is evidence that vaccines can be made safer. To increase vaccine confidence vaccine manufacturers must again be legally liable for the harm and death caused by their products.

3 Denying Vaccine Injury

Every pharmaceutical product, no matter how well designed or intended can cause harm. To promote vaccines as "safe and effective" without any conditions or qualifiers and to deny vaccine injury as a matter of policy erodes confidence that the product information is accurate and independent from industry influence. Saying all vaccines are safe and effective is like saying all prescription drugs are safe and effective. The statement also implies that all vaccines are safe and effective for all people. This obviously isn't true given the US Vaccine Court has awarded more than \$3.7 billion dollars in compensation for vaccine injury since 1989 and the US Supreme Court ruled that vaccines are "unavoidably unsafe".

4 Personal Attacks

The medical industry and mainstream media intentionally marginalize and name-call parents and others who question vaccine safety and effectiveness. Scientists examining vaccine safety report they are routinely attacked because of their efforts to investigate vaccine safety.

5 A One Size Fits All Approach

The vaccine paradigm utilizes a 'one-size- fits-all' approach. Vaccine dosage is not calibrated by age, weight, immune response, gender, genetics, medical or family history, or other variables used to discern safe levels of a medical intervention. In no other area of medicine are individual variables systematically ignored. It is difficult to have confidence in a program that ignores individual patient consideration.

6 No Individual Risk-Benefit Consideration

The decision whether to vaccinate or not ought to be evaluated on a disease-by-disease basis, a vaccine-by-vaccine basis, and an individual-by-individual basis. The merit of a vaccine ought to be determined by taking into consideration the risk of getting the disease, the consequences of getting the disease, the effectiveness of the vaccine, and the safety of the vaccine for the individual. This does not occur in the vaccine paradigm. Universal vaccination is not science. It is ideology.

7 Belief or Coercion as the Basis For Vaccine Decisions

The decision to vaccinate or not is one of the most important decisions a responsible parent is required to make. At Vaccine Choice Canada we think it is important that we push beyond using belief or coercion as the basis for vaccine decisions and instead decide from a place of information based on good quality scientific evidence.

**BECOME INFORMED AND JOIN US IN
PROTECTING OUR HEALTH FREEDOMS.
YOUR CHILD | YOUR FUTURE | YOUR CHOICE**

Our health is dependent on our willingness to take responsibility for our health and that of our children, the courage to ask questions, and our ability to gather sufficient information to make well-informed decisions.

www.vaccinechoicecanada.com
info@vaccinechoicecanada.com

Our mission is to empower individuals to make informed health care choices and voluntary vaccine decisions for themselves and their children.

How to Reduce Vaccine Hesitancy

The vaccine industry is concerned with the increasing number of "vaccine hesitant consumers" and the growing decline of trust in the medical industry.

An increasing number of parents are opting out of one or more vaccines through the use of philosophical and religious exemptions where they exist. In response, the medical industry has been lobbying governments to enact legislation to remove or limit religious and personal exemptions and to make vaccines mandatory.

This action represents a clear intent to impose this medical practice by coercion rather than consent.

**BUT WILL THE
STRATEGY OF FORCED
VACCINATION WORK?**

What will work

1 Provide Solid Clinical Evidence of the Safety and Effectiveness of the Vaccine Schedule

Currently there is a lack of solid scientific evidence of vaccine safety and effectiveness. Until there is clear and compelling evidence any efforts to assure vaccine hesitant parents will fail. The lack of evidence includes the following:

- ▶ There are no long-term clinical trials that prove the safety of the current vaccine schedule.
- ▶ Most effectiveness trials are limited to the measurement of antibodies in the blood rather than producing verifiable evidence that the vaccine actually prevented the targeted disease.
- ▶ No safety trials exist that determine the safety of giving multiple vaccinations at once.
- ▶ No large safety trials using an unvaccinated population as the control group have proven that vaccines are safe and effective.
- ▶ The current vaccine schedule has never been tested for safety in the real world way in which the schedule is implemented.
- ▶ No clinical proof exists to support the claim that vaccines are responsible for the decline in mortality, let alone the claim of millions of lives saved.
- ▶ There are no biological studies that show injecting mercury is safe in any amount.
- ▶ No clinical trials have been conducted to establish the safety of using aluminum in vaccines.

2 Open and Honest Dialogue

Honesty, openness, and public accountability are important safeguards. Currently the medical industry and mainstream media actively discourage open dialogue and honest debate about vaccine safety, efficacy and necessity.

3 Fully Informed Consent

Current efforts to increase vaccine compliance include coercion, fear-mongering, financial incentives and disincentives, punishment, restriction to education, childcare and employment, even imprisonment. The lack of fully informed consent undermines trust, erodes the doctor-patient relationship, and undermines an important safeguard to ensure products are safe and effective.

4 Independent Oversight

Federal public health agencies responsible for monitoring vaccine safety are also responsible for increasing vaccine uptake. And those responsible for licensing vaccines routinely benefit from the sale of vaccines. As of June 2017 all nine voting members of the National Advisory Committee on Immunization in Canada declared direct or indirect financial or intellectual conflicts of interest.

5 Vaccine Injury Compensation

Canada is the only G7 nation without a national vaccine injury compensation program. If you or your child is injured or killed by vaccination, you are on your own. An independent, easily accessible, fair and transparent vaccine injury compensation program would assist in reducing vaccine hesitancy.

6 Long-Term Safety Testing

Vaccines have not been tested for carcinogenicity, toxicity, genotoxicity, mutagenicity, the ability to impair fertility, the impact on pregnant women and fetuses, and for long-term adverse reactions. The lack of testing to determine the long-term impact of vaccination undermines confidence in industry and government claims of vaccine safety.

7 Tell the Truth About Autism Research

It is unscientific and perilously misleading for the CDC and Health Canada to assert that vaccines and autism have been exhaustively studied and that no connection has been found. While there are a handful of industry-funded studies that are regularly cited by critics of the vaccine-autism hypothesis, these studies examine only one vaccine product (MMR) and one vaccine ingredient (Thimerosal). It is illogical and dishonest to exonerate all vaccines, all vaccine ingredients, and the total vaccine schedule based on such limited epidemiological studies.

8 Provide Evidence Vaccines Improve Health

Vaccine manufacturers are not required to demonstrate vaccines actually reduce the rate of disease contraction, contagion, complication or mortality and improve health. It is simply assumed that elevated antibody levels equate to immunity despite the lack of supporting evidence. Vaccines are the only medication where evidence of improved health and absence of harm are not required before approval.

9 Conduct Vaccinated vs. Unvaccinated Studies

Most vaccine safety trials use control groups consisting of other vaccinated populations or placebos containing aluminum. These are not true placebos. The failure of the vaccine industry to use a neutral placebo undermines the integrity of Federal health agency claims that vaccines have been proven to be safe and effective. Until true vaccinated vs. unvaccinated research is conducted any claims of vaccine safety and effectiveness is an assumption and not scientifically proven.

"Immunization is a complicated topic that needs more reflection and less coercion. **It's time to realize that vaccines, like medicines, are not a mystic panacea** and that they are subject to the commercial and political pressure and also to the influence of conflicts of interest."

~ Dr. Claudina Michal-Teitelbaum, MD

"All vaccines are not created equal. Discussion of both the benefits and the risks of individual vaccines is needed. The authoritative medical bodies must end their arrogant stance and take an honest look at the literature they have suppressed. **Negative effects must be honestly brought to light.** Legislative bodies need to do their homework and reject any thought of mandating vaccinations."

~ Dr. Ralph Campbell, MD
