

COVID-19 Vaccines May Put Your Baby at Risk

FACT: COVID-19 mRNA vaccines contain genetic technology that has not been proven safe in pregnancy.

Concerns have been raised that the mechanism of action of the mRNA vaccines (Pfizer and Moderna) could cause an autoimmune rejection of the placenta.^{[1] [2]}

This means that the vaccine may permanently interfere with the ability to maintain a pregnancy.

COVID-19 vaccine manufacturers acknowledge the potential of this adverse effect and advise women to avoid pregnancy for at least two months after the second dose.

Some medical experts suggest that women of childbearing age delay making their decisions about this experimental vaccine until the risk to the placenta is fully known, in order that fully informed choices can be made.
